

# Environmentally friendly

## GREEN POLICY

Finfloor decorative laminate flooring is made of raw materials from renewable resources using wood waste for the substrate from hardwood forests which are under strict forest management control or what we call 'plantation' forests. This eliminates the need to extract wood from natural forests, thus making Finfloor a natural product that is environmentally friendly and totally biodegradable. The design layer is reproduced, by taking a photo of the real timber, using sophisticated technology. Wood decors are reproduced to look like the original timber and give you that true-to-life wood look and feel without having to exploit our natural forests.

Finfloor's completely sealed non-porous surface does not allow the breeding of dust mites or micro-organisms, unlike some other floor covering materials. This creates a healthier environment for our little ones. All these superb qualities make Finfloor the best option available today when it comes to selecting a floor covering material, whether it is for your home sweet home or for your business premises or office. In addition, Finfloor has also been recognised by the Singapore Environment Council as a Green Product or Eco-Friendly Product that meets stringent environmental regulations, proving that a good quality product can also be environmentally friendly at the same time.
